

Minutes of the Meeting (MOM)

Project: Document Tracker with Multilevel Review System **Client:** (DOST-STII)

Attendees:

- **DOST-STII Representatives:** Arjay Escondo, Ma. Giselle Geraldino, Chai Lim
- **Development Team:** Team RRuNS

Summary

The development team presented their proposed system solution, covering technical architecture, AI integration features, and initial UI wireframes. DOST-STII provided feedback regarding AI behavior, duplicate detection logic, workspace integration, and requested a formal project development roadmap. Initial prototype review is targeted for October, with complete system development scheduled across a 5–6 month timeline.

Key Decisions Made

- **AI Role & Boundaries:** The AI module performs preliminary reviews only and serves as guidance. It has no authority to approve, reject, or automatically modify document contents; reviewers retain final decision-making power.
- **Side-Panel Suggestions UI:** AI revision recommendations will display in a dedicated side panel alongside the main document workspace (similar to Google Gemini) rather than inline or auto-applied.
- **Duplicate Detection Control:** Duplicate submission detection (full content scan) will be implemented as an opt-out feature with a manual trigger/switch to accommodate standard DOST-STII documents that legitimately reuse templated text.
- **Database Choice:** MySQL was confirmed as the target database.

Presented Topics & Completed Scope

1. Statement of the Problem

- Lack of data integrity and security
- Separated data and lack of centralized tracking
- Reliance on manual notifications
- Absence of a traceable revision history

2. Technical Background & Architecture

- Defined front-end, back-end, and database specifications.
- Configured role-based access control, derivation tracking, reference number generation, chunking, and email notifications.
- System design and security will undergo review by DOST-STII's MISPS unit prior to deployment.

3. Proposed AI Scope

- **Preliminary Document Review:** Natural Language Processing (NLP) analyzes document context before human review and uses pattern recognition to flag recurring issues based on historical reviewer remarks.

- **Duplicate Detection:** Scans full content structure rather than relying solely on file names.

4. Initial UI Concept Review

- Walkthrough of initial concept screens: Submitter Dashboard, Reviewer Dashboards (Level 1 & Level 2), Division Chief Dashboard (final approval), and Super Admin Dashboard (audit logs, user roles, holiday calendar).

Pending & Open Items

- **Workspace Integration:** Current scope processes uploaded files; team will evaluate read access for live workspace links (e.g., Google Docs, Google Sheets).
- **Data Export:** Export functionality acknowledged as a requirement; implementation details to be finalized during core development.

Action Items & Next Steps

- **Dev Team:**
 - Draft and share a formal development roadmap outlining project milestones, development phases, and DOST-STII review checkpoints.
 - Add an opt-out/toggle switch to the duplicate submission detection module.
 - Design a side-panel interface for AI revision suggestions.
 - Build a consolidated back-end database of historical reviewer remarks/comments (filtered by material type) to serve as a dataset for AI training.
 - Scope potential read-access integration for live Google Docs and Sheets.
 - Prepare a working prototype for client demonstration around October.
- **DOST-STII:**
 - Review and approve the development roadmap upon submission.
